TITLE: A differential method of determining the azimuth  
of a distant earthquake

SOURCE: AN SSSR. Sibirskoye otdeleniye. Institut zemnoy  
kory, Trudy, no. 18, 1964. Voprosy seismichnosti Sibiri  
(Problems in the seismicity of Siberia), 136-150

TOPIC TAGS: earthquake, epicenter, seismic wave,  
seismicity, ~~seismogram~~ SEISMOGRAPHY

ABSTRACT: After mentioning M. N. Kolosenko's method of  
determining earthquake azimuths by using seismograms from  
two widely separated seismic stations published in 1955,  
the author describes an analytical method which utilizes  
the data from 2 or 3 closely located stations. Assuming  
that the stations are located on either a plane or a  
curved surface, several simple formulas are derived for  
the determination of earthquake azimuth and the azimuthal  
corrections, due to errors in marking initial arrivals,  
assumed apparent velocities, and station distributions,  
are evaluated and expressed graphically. The investiga-  
tion shows that 1) the mean square error in determining

Card 1/2

ACC NR: AT6036920

the epicentral distance ( $\Delta$ ) is a function of  $\Delta$ , the mutual distributions of stations, and the azimuthal angle;  
2) azimuth determinations using mean values of the results obtained from territorially-independent groups of seismic stations can be performed by using simple formulas; and  
3) in determining the epicenter locations from the data on azimuths and cross sections, the S-P differences should be carefully evaluated. Orig. art. has: 14 figures, 22 formulas, and 2 tables.

AUTHORS: Golenetskii, S. I., Nasinov, L. I., Filimonov, Yu. I.

TITLE: The  $\alpha$ -Decay of Isomeric  $\text{Bi}^{210}$  ( $\alpha$ -raspad izomericheskogo  $\text{Bi}^{210}$ )JOURNAL: Zhurnal eksperimental'noi i teoreticheskoy fiziki, 1958,  
Vol. 34, No. 1, pp. 171-174 (USSR)

ABSTRACT: At the decay of radioactive  $\text{Bi}^{210}$ , a long-lived isomer  $\text{RaE}$  ( $T_{1/2} = 2.6 \cdot 10^6$  years) is produced in addition to RaE ( $T_{1/2} = 5$  days,  $E_{\beta \max} = 1170$  keV). The present paper investigates the decay of this long-lived  $\text{RaE}$ . The spectrum of  $\alpha$ -particles was investigated by means of a momentum ionization chamber filled with a mixture of 30% Ar + 10%  $\text{CH}_4$ . It enriched and chemically purified  $\text{Bi}^{210}$  sample with a specific activity of 14,000 decays per minute and milligram was investigated. The  $\alpha$ -spectrum measured in this way is shown in a diagram. Besides the previously observed particles with  $E_{\alpha} = 10$  keV, new groups of  $\alpha$ -particles with the energies of  $1090 \pm 10$  keV and  $1140 \pm 30$  keV are found. The relative intensities of these

Card 1/3

The  $\alpha$ -Decay of Isomeric  $Tl^{210}$

C. V. S. - 1-1-26, 1

Three  $\alpha$ -transitions amounted to 60.30 and 1.5. In about 1% of  $\alpha$ -decays also  $\gamma$ -radiation occurs. It was investigated by means of a spectrometer consisting of the photoelectric multiplier FEU-13 and of a multichannel analytical analyser. The  $\gamma$ -spectrum of the  $Tl^{210}$ , which was measured, is shown in a diagram.  $\beta$ -transitions with the energies  $2.0 \pm 10$  keV and  $300 \pm 10$  keV and the relative intensities 1 and 0.4 probably occur. The line with  $17 \pm 5$  keV is caused by the characteristic X-ray radiation of bismuth. An additional maximum in the range of 40 keV requires additional investigation. For the purpose of confirming the assumption that  $\gamma$ -rays having energies of 170 and 300 keV correspond to the transitions of an excited  $Tl^{210}$ -nucleus, the  $\alpha$ - $\gamma$ -coincidences were investigated.  $\gamma$ -rays with energies of 300 and 340 keV are actually in coincidence with the  $\alpha$ -particles of  $Tl^{210}$ . According to the results obtained,  $Tl^{210}$  actually seems to have excited states with energies of 40 and 300 keV. A decay scheme for the observed  $\alpha$ - and  $\gamma$ -transitions is given. The authors thank Ye. I. Gacheva, N. N. Svetlichny, T. N. Shchekinovskaya, and L. Ya. Rybach for the technical purification of the radioactive impurities and for receiving the samples. There are 1 figure and 3 references.

TITLE:

On the Decay Scheme of the Isomer Bi<sup>210</sup>

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,  
Vol 37, Nr 2(8), pp 560-561 (USSR)

ABSTRACT:

As an introduction reference is made to several previous papers concerning this isomer. This paper gives a report on further investigations of the long-lived bismuth isotope, which necessitated a change in the decay scheme of Bi<sup>210</sup>. The measurements were carried out by means of a pulse ionization chamber with a grid and a  $\gamma$ -spectrometer. In two tables the results of the energy measurements and of the relative intensities of the  $\alpha$ -particles and of the  $\gamma$ -transitions (which accompany the decay Bi<sup>210</sup>) are compiled. The  $\alpha$ - $\gamma$  coincidences were investigated for the determination of the decay scheme of Bi<sup>210</sup>. A scintillation counter was used as a  $\gamma$ -radiation detector, which had been connected with the pulse ionization chamber in a coincidence circuit. The spectrum of the  $\gamma$ -radiation was measured. When

Card 1/3

On the Decay Scheme of the Isomer Bi<sup>210</sup>

SO7/56-37-2-39/56

coincides with  $\alpha$ -particles of a certain energy. The results of these measurements are given in two diagrams. Coincidences have been found of the most intensive group of  $\alpha$ -particles (with an energy of 4930 kev) with the  $\gamma$ -rays with an energy of 260 kev. These  $\alpha$ -particles therefore do not correspond to the transition to the ground state of Tl<sup>206</sup> (as has been previously assumed), but to an excited state with the energy 260 kev. Besides the coincidences of  $\gamma$ -rays with an energy of 300 kev with the  $\alpha$ -particles with an energy of 4890 kev and of  $\gamma$ -rays with  $E_{\gamma} = 340$  and 620 kev with  $\alpha$ -particles with an energy of 4590 kev have been found. The maxima corresponding to  $E_{\gamma} = 260$  and 300 kev are caused both by cascade transitions and by coincidences with scattered  $\alpha$ -particles with  $E_{\alpha} = 4930$  and 4890 kev. The number of  $\gamma$ -transitions observed is approximately equal to the total number of the  $\alpha$ -decay processes. On this basis the authors propose a new decay scheme for Bi<sup>210</sup>, which is portrayed in a figure. The energy  $E$  of the  $\alpha$ -decay of Bi<sup>210</sup> to the ground state of Tl<sup>206</sup> can be calculated from the energy

Card 2/3

On the Decay Scheme of the Isomer Bi<sup>210</sup>

SOV/56-37-2-39/56

balance. It is  $Q_{\alpha} = (5064 \pm 15)$  kev. The total decay energy of the  $\alpha$ -decay of the long-lived isomer of Bi<sup>210</sup> is  $Q_{\alpha} = (5286 \pm 15)$  kev, considering the recoil nucleus and the energy of the  $\gamma$ -quanta. RaE with  $T_{1/2} = 5.01$  days is the ground state of Bi<sup>210</sup> and the state with  $T_{1/2} = 2.6 \cdot 10^6$  years is metastable. The authors express their gratitude to L. A. Sliv for discussing the results of this work, and to Ye. G. Gracheva, N. B. Obel'skaya, V. K. Makhnovskaya, and L. Ya. Rudaya for the chemical purification of the preparation from radioactive admixtures and for producing the samples. There are 3 figures, 2 tables, and 3 references, 1 of which is Soviet.

Standardization of methods of determination of the viscosity of petroleum products. P. M. Golomyan. U.S.S.R. Standard No. 144, Moscow, 1948. *Izdat. Matematicheskogo Instituta im. Steklova. Trudy Matematicheskogo Instituta im. Steklova. Ser. A. Voprosy Teorii Viskoziteta i Znachokel'ya Vektorov. Izdat. Akad. Nauk SSSR, 1948.* *Zhurnal Tekhnicheskoy Kibernetiki i Vychislitel'noy Tekhniki. No. 2. 1948.* For the conventional Engler method, U.S.S.R. specifications permit deviations of 0.5-1.5%, corresponding to 1% in control values. For low viscosities (from 1 to 12 cSt) the permissible deviation is 1.5%, or 2 Engler degrees (corresponding to 1.10% viscosity). Actual divergence of data by various laboratories often higher than the max. permissible error. For the same sample (anted 18), 14 different control labs reported figures in "E", diverging by from -5.4% to +12% from the av. at 50°. Engler's method is not applicable beyond about 140 centistokes. For the conversion of 1 into centistokes, 4 different formulas have been proposed:  $\nu_{cst} = 14.1 \cdot 10^{-4} \cdot (T - 50)$ ;  $\nu_{cst} = 14.3 \cdot 10^{-4} \cdot (T - 50)$ ;  $\nu_{cst} = 8.28 \cdot 10^{-4} \cdot (T - 50)$ ;  $\nu_{cst} = 6.31 \cdot 10^{-4} \cdot (T - 50)$ ; none of these formulas is accurate (no gpm). The U.S.S.R. specification "GOST 144" has said that the Ostwald-Peukert-Punktovich viscometer, determining data up to 10,000 centistokes, between 20° and 60°, has the permissible deviation for max. 140 cSt of 0.5%, for 50° of 0.8%. Actual deviations are likely to be the permissible max. A projected standard for low temp. viscosity values, "A" (GOST 144-70), 10,000 poise, the deviations down to 0.6% at -50°, 10,000 poise, over 100,000 poise. Abandonment in industrial practice of relative (upper) units and exclusive adoption of absolute (lower) units is recommended. N. I. Danin

TITLE: Automobile Gasolines (Benziny avtomobil'nyye)

PERIODICAL: Standartizatsiya, # 1, Jan-Feb 1957, p 50-51 (USSR)

ABSTRACT: The gasoline standard "TOCT 2084-51" is superseded by "TOCT 2084-56" which will come into effect on 1 July 1957. The new standard covers 4 gasoline grades: "A-66", "A-72", "A-74", and A-76". The grades "A-72" and "A-76" have octane numbers 76 and 80 respectively and are destined for overhead valve engines with increased compression, planned by the Soviet automobile industry. In comparison with the old grades, the gasolines "A-72" and "A-76" will be improved in fractional composition (end of boiling at not over 195° C instead of former 205° C), content of resins (not over 5 mg instead of 10 mg), and induction period (not less than 480 minutes instead of 240 minutes). To reduce formation of resin, the new gasoline will get an addition of an antioxydant (wood resin, or paraoxydiphenylamin). The grade "A-66" special, also included in the new standard, is destined for the northern regions and Siberia in winter. This gasoline will have the end of boiling at below 190° C (instead of 205° C), lower resin content (not over 7 mg instead of 10 mg in 100 ml), and longer induction period (not less than 360 minutes instead

Card 1/2

Automobile Gasolines

28-1-13/42

of 240 minutes), maximum sulfur content of not over 0.3 % instead of 0.6 %. The current gasolines consist basically of two components: direct rectification gasoline with octane number of 44-66 (by engine test method) and thermal cracking gasoline with octane numbers between 62 and 68.

AUTHOR: Golenev, P.M., Engineer 29-1-31/4:  
TITLE: Losses of Oil Products Have to Be Eliminated (Ustranit' poteri nefteproduktov)  
PERIODICAL: Standartizatsiya, # 1, Jan-Feb 1957, p 78 (USSR)  
ABSTRACT: The standard "FOCT 1510-50" for the packing, marking, transporting, and receiving of oil products sets a maximum level of 3 cm (corresponding to 30-40 kg) of residue in the tank cars after reception. A check by the Standards Committee in the third quarter of 1956, at a number of washing-and-steamblowing stations, revealed that in half of the tank cars the residues exceeded this. For instance, between 1 January and 20 September 1956, 12.2 tons of gasoline were left in the tank cars of the Stalingrad oil depot, and 11.4 tons in the tank cars of the Volga-Region-Railroad. Incomplete data for 5 months show that several thousand tank cars with excessive residues came to the washing-and-steamblowing stations. The author states that this shows carelessness of consignees as well as poor supervision on the part of railroad workers. At the Novo-Kuybyshevskaya washing station official notes are only made if residues exceed the 10 cm level, and often no notes are made at all. No official notes were made at the railroad stations of Khabarovsk 2, Gumrak

and Gor'kiy. All this results in high losses of liquid fuel, handicaps the preparation of tank cars for re-filling, extends the idle time, and creates an opportunity for thievery. The standard "TOCT 1510-50" covers oil products only. Similar standards ought to be established for transporting chemical and other liquid products.

TITLE Airplane Oil From Sulfurous Petroleum

PERIODICAL Standartizatsiya, 1960, No 6 p 54

TEXT: EDN/ 9320-60 (GOST 9320-60) or "Airplane Oil "C-20S (MS-20S) Technical Requirements" came into force on April 1, 1960; this oil is produced from the sulfurous types of petroleum occurring in the eastern districts. As compared with the oil "C-20 (MS-20) produced from poorly sulfurous petroleum types according to EDN/ 1013-49 (GOST 1013-49), MS-20S shows a better temperature dependence of the viscosity change, is less corrosive and inflammable at higher temperatures. Experiments on the test stand and in airplane engines gave positive results. Therefore, the Gosudarstvennyy nauchno-issledovatel'skiy institut Grazhdanskogo vozduzhnogo flota SSSR (State Scientific Research Institute of the USSR Civil Air Fleet) decided that the oil MS-20S may be used for the same purposes as the oils MS-20 and MK-22 (MK-22) produced from

Caro 1/2

TITLE: To New Successes (K novym uspekhам)

PERIODICAL: Grazhdanskaya aviatsiya, 1958, Nr 12, p 13 (USSR)

ABSTRACT: The speaker appealed to his audience to intensify the study and training on the new Il-18 turboprop planes in anticipation of their introduction into regular service in 1959. He praised the members of his unit for overfulfilling the plan in the 11 months of 1958, and suggested that they pledge similar records in December 1958 and January 1959.

TITLE: Nonresonance paramagnetic signal absorption in chrome-polymer alums

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 41, no. 1, 1963, 63 - 64

TEXT: The absorption was measured at  $\nu = 3 \cdot 10^7$  cps in dependence on a permanent magnetic field by observing the variation in the  $\omega$  of a generator circuit. The sonic field was directed along the trigonal symmetry axis of the crystal field of one of the non-equivalent Cr<sup>3+</sup> ions. The line width was greater by about an order of magnitude than the line width for a variable field. This is attributed to isotropic exchange interaction and the presence of dislocations. The absorption coefficient follows the law

$$\alpha(\nu) = \frac{G^2 E^2}{K^2 \rho v} \frac{\lambda^3 (1 + \sin^2 \theta)}{(2s+1)^2} \frac{4s(s+1) - 3}{\lambda^2},$$

where G is the spin-lattice interaction parameter (Ichiguro, K. Yambe, J. Card 1/2

Nonresonance paramagnetic sound ...

1966/04/001/012/067  
B108/B160

Igui. Phys. Rev., 82, 680, 1951), N the number of paramagnetic spins per unit volume,  $g(v)$  a function of the shape of the absorption line,  $v$  the velocity of sound. With the parameters  $g(v) \approx 1/4 v^{-1} 0.25 \cdot 10^{-9}$ ,  $s = 3/2$ ,  $G = 10^{-15}$  erg is found, which agrees with published data (C. Kittel. Phys. Rev., Lett., 6, 449, 1961). The absorption is mainly due to spin-spin magnetic interaction. There is 1 figure.

TITLE: Nuclear quadrupole resonance in ferroelectric domain walls

SOURCE: Fizika tverdogo tela, v. 6, no. 4, 1964, 1251-1253

TOPIC TAGS: nuclear quadrupole resonance, ferroelectric, ferroelectric domain, ultrasonic perturbation, electric field perturbation, nuclear quadrupole energy operator

ABSTRACT: Theoretical computations are made of the effect of excitation of nuclear quadrupole resonance (NQR) in the domain walls of ferro- and antiferro-electrics by application of ultrasonics or a variable electric field at the resonant frequency. The variation of the electric field gradient inside the domain wall at the quadrupole nucleus is due to the shift of the wall relative to the nucleus (electric field effect) or of the nucleus relative to the wall (ultrasonic effect). These shifts have various amplitudes and at NQR frequencies are out of phase, hence the effects of ultrasonics and the electric field can be considered separately. It is assumed that the relative shift of nuclei and walls takes place

Card 1/3

ACCESSION NR: AP4028468

in a direction  $x$  perpendicular to the domain wall. The nuclear quadrupole energy operator takes the form:

$$R\mathcal{E}^i = \frac{1}{4} \alpha (I/I_{\pm} + I_{\pm}/I) (1 - \gamma) \langle v_{zx} \rangle, \alpha = \frac{e_i Q}{I(3I-1)}$$

where  $\xi$  is the number of charges on particle  $i$ ,  $\alpha$  is electron charge,  $Q$  is the quadrupole moment of nucleus  $i$ ,  $\gamma$  is the anti-shielding factor,  $\langle v_{zx} \rangle$  is the average amplitude of variation of the electric field gradient component  $v_{zx}$ ,  $I$  is the nuclear spin, and  $z$  is the direction of spontaneous polarization. For  $90^\circ$  walls with perturbation by an electric field of amplitude  $E$ ,

$$\langle v_{zx} \rangle = (4\sigma v_{so})^{-1} M_s \mu (E - E_c)$$

where  $\sigma$  is the wall thickness,  $E_c$  is the critical field and  $\mu$  is the wall "mobility". For  $E = 0.6$ ,

$$\langle v_{zx} \rangle \sim 10^{19}$$

Card 2/3

ACCESSION NR: AP4026468

With a relative deformation  $u_{xx}$  due to ultrasonic perturbation,

$$m_0 \langle v_{xz} \rangle = \frac{M_x}{\lambda} u_{xz}$$

Then for  $u_{xz} = 10^{-4}$

$$\gamma \langle v_{xz} \rangle \sim 10^{10}$$

TYPE: Relaxation paramagnetic absorption of sound and variable magnetic field

SOURCE: Ref. in: Fizika, Abs. 6D361

REF SOURCE: Kazansk. fiz.-tekhn. in-t, Kazan', 1965

TOPIC TAGS: paramagnetic absorption, magnetic field, paramagnetic sound absorption, relaxation paramagnetic absorption, variable magnetic field, variable acoustic field, paramagnetic crystal, exchange reaction

ABSTRACT: A general theory of paramagnetic relaxation absorption of energy produced by an arbitrary external generator interacting with a spin system is developed. The analysis of the interaction of variable magnetic and acoustic fields with a paramagnetic crystal is given as an example. The results are expressed in the form of a function of irreducible tensor operators which makes it possible to apply the derived formulas to all outside disturbances with analogous symmetry properties. It is shown that the method of suppressing relaxation absorption by a

Card 1/2

ACC NR: AR7000343

static field makes it possible to obtain information on exchange reactions in crystals. The effect of exchange suppression of relaxation absorption was studied in nickel fluorosilicate and confirms the theoretical deductions. Measurements are made of the spin-phonon interaction constant in nickel. [Translation of abstract]

TITLE: Acoustic paramagnetic spectrometer

SOURCE: Pribory i tekhnika eksperimenta, no. 2, 1965, 126-130

TOPIC TAGS: spectrometer, paramagnetic spectrometer, acoustic spectrometer, sound absorption, acoustic resonator

ABSTRACT: A device for measuring sound absorption by paramagnetics is described; continuous generation at 10—70 Mc within a temperature range of from liquid-hydrogen to room temperature is used. The effect of the acoustical resistance of a specimen placed in a static magnetic field upon the reaction of the r-f oscillator is measured. The nonresonance sound absorption in potassium chrome alum and in copper sulfate for various magnetic-field intensities was measured. The acoustic spectrometer makes it possible to measure variations of the absorption factor from  $10^{-3}$  to  $10^{-6}$  per cm with the damping factor  $\alpha_0$  approximately  $10^{-2}$  per m. The maximum measurable absorption in the magnetic field  $g_m = 10^{-2}$  to  $10^{-3}$  per cm. A block diagram of the outfit and a sketch of the acoustic resonator are supplied. Orig. art. has 4 figures and 7 formulas.

The Application of the Monte-Carlo Method  
in the Simulation With Limitations on the Influence  
of the Layout of the Simulation Program (An Application  
of the Monte-Carlo Method for Statistical Simulation  
With Limitations on the Influence of the Layout)

PUBLISHER:

Academy of Sciences USSR, Moscow, 1970, 8 pp.,  
in Russian (copy).

ABSTRACT:

This paper gives the results of the calculations  
(carried out by means of the Monte-Carlo (Monte  
Carlo) method) of the influence of the layout  
on the influence of the simulation units. These  
numerical calculations are concerned to be produced  
by means of initial numbers of tall and spic  
etc. The calculations were carried out by taking  
into account the layout (not of the program) of  
the layout of the elementary statistical programs.

Check List

The calculation of the electron scattering cross section was carried out with consideration of the influence of the medium on the form factors.

Two variants of the form factor medium. In the first variant only the relations of Bethe (Ref. 1) and Heitler (Ref. 2) for the elementary form factors were used, and in the second variant the formulae of A. B. Lippmann (Ref. 3) were used in account. In account the influence exerted by the field upon the position parameter of the electron form factor. The position of the wave function of the electron was calculated in account. The cross sections of the coherent production were calculated for the nuclear medium IBM-1 (IBM-3) G-1. Both the two-variant variants have the following results: 1) The energy dependence of the scattering cross section in the range of 1-10 GeV; 2) The energy dependence of the ratio of the cross sections of the coherent production of the nucleon and the deuteron in the range of 1-10 GeV.

TITLE Monte-Carlo calculations of the gamma-ray energy absorption  
in a reactor system

PERIODICAL Zhurnal vychislitel'noy matematiki i matematicheskoy fiziki,  
v. 1, no. 6, 1981, 1081-1096

TEXT The authors calculate the trajectories of gamma-quanta in a reactor  
in Fig. 1. The trajectory of a single quantum is represented by a  
broken line.  $W_1$ ,  $W_2$ , and  $W_3$  are the probabilities of the trajectory  
ending, of a new section beginning, and of two new sections beginning,  
respectively ( $W_1 + W_2 + W_3 = 1$ ). For the length  $l$  of a section, the equation

$$\int_0^l a(\vec{r} \cdot \vec{\hat{n}}) d\theta = 1 - \{ \}$$

is solved, where  $\{$  is a value within a homogeneous distribution of random  
numbers in the interval  $[0,1]$ , and where the function  $a$  indicates the  
"area" of  $\vec{r}$ .

TITLE: Random number data unit for computer "Strela"

SOURCE: Voprosy\* vychislitel'noy matematiki i vychislitel'noy tekhniki. Moscow, 1963, 212-221

TOPIC TAGS: data unit, random number, noise generator, pulse shaper, germanium diode, statistical criterion, weighted sum

ABSTRACT: The details of a data unit for random numbers consisting of 12 noise generators, 12 switches, 12 pulse shapers, 12 triggers, and 12 output inverters have been presented. In octal system, the random number cell is assigned the number 7757. Each electronic element is discussed in detail. The noise generator consists of a germanium diode noise element and 3 cascade amplifiers. The pulse shapers are used with triggers to ensure a uniform position distribution for the 0 and 1 digits on the triggers. To evaluate the quality of the data unit and to establish some reliability criterion for its operation, the randomness of the numbers is studied by the series method, which uses a statistical criterion to

Card 1/2

ACCESSION NR: AF3012139

determine the degree of association existing the random succession in the formation of numbers. Next, the uniformity of the random number distribution is determined by the Pearson criteria which uses  $\chi^2$  distribution as the weighted sum of the square of deviation between  $\nu_i$  and  $n\nu_i$ , or

$$\chi^2 = \sum_{i=1}^{n-1} \frac{(\nu_i - n\nu_i)^2}{n\nu_i}$$

where  $\nu_i$  is the quantity of selected values in the i-th interval and  $n\nu_i$  - mathematical expectation of  $\nu_i$  in a hypothetical theoretical distribution. It is shown that the data unit satisfies both criteria and materially reduces the time for solving problems in statistics. 60 p., art., incl. 10 equations and 6 figures.

TITLE: Stability of an airplane when fuel in the tanks is in motion

SOURCE: Moscow. Vyssheye tekhnicheskoye uchilishche. [Trudy], no. 104, 1961. Mekhanika, 171 - 176

TEXT: The following linear problem is presented: The airplane moves along an almost horizontal trajectory and during the unperturbed motion the axis of symmetry of the plane coincides with the velocity vector of its center of gravity. A first order perturbation is introduced, the equations of the perturbed motion of the system of plane-fluid are constructed and reduced to an infinite system of ordinary linear differential equations, which can be solved by the method of reduction. TITLE: Fluorimetric investigation of secondary luminescence of lymphocytes from irradiated rat lymph nodes

SOURCE: Radiobiologiya, v. 5, no. 5, 1965, 685-689

TOPIC TAGS: experiment animal, irradiation effect, cell physiology, luminescence

ABSTRACT: Albino male rats weighing 200 g were X-irradiated (RUP-200-20-5 unit, 170 kv, 15 ma, 40 cm focal length, 0.8 cm Al + 0.5 cm Cu filters, 44 r/min) with a 500 r dose and killed 5 to 10 min, 2, 3, and 12 hrs later. Lymph nodes taken from the animal's groin were cut open and lymph tissue was carefully removed and suspended in a physiological solution. The tissues were stained with acridine orange to determine secondary luminescence of average and small lymphocyte nuclei with a microscope-cytofluorimeter, sensitive to the green band of the spectrum. Luminescence was excited by a light wave length of 436 millimicrons and was measured in the 510 to 550 millimicron range. Arithmetical mean

values for nuclear luminescent intensity were computed for cells in experimental and control samples. Results show that with a microfluorimeter small differences in fluorescent intensity can be detected in the lymph nodes of normal animals which apparently reflect the aging processes and cell degeneration. In 5 to 10 min following a 500 r dose a statistically reliable increase in intensity of lymphocyte nuclei luminescence is found. Two hours later a considerable number of cells appear with bright orange luminescence of the nuclei reflecting the pyknotic process and also intensification of the relative irradiation effect which reaches a maximum after 3 hrs. The level of the relative irradiation effect after 12 hrs is reduced to the level observed after 2 hrs; a possible explanation for this may be that the damaged cells are destroyed by macrophages and lytic agents of the organ. The authors "express their gratitude to M. N. Meysel, Corresponding Member of AN SSSR, for his guidance and helpful advice, V. Yu. Urbakh for consultations on statistical processing of data, and A. A. Zotikov for his assistance." Orig. art. has: 1 table and 1 figure.

TITLE: Method of obtaining bis-cyclopentadienyl titanium dichloride. Class C 07f; 12c, 26 sub 03. № 152877

SOURCE: Byul. izobreteniy i tovarnykh znakov, no. 3, 1963, 19

TOPIC TAGS: bis-cyclopentadienyl titanium dichloride, production, suspension phase

ABSTRACT: A method of obtaining bis-cyclopentadienyl titanium dichloride by interaction between cyclopentadienyl sodium and titanium tetrachloride in the presence of aromatic hydrocarbons such as toluol; its distinguishing feature is that in order to simplify and cheapen the process it is carried out in the suspension phase. TITLE: Stereospecific polymerization of butadiene in the presence of catalyst  
systems based on  $\pi$ -cyclopentadienyl complexes of nickel

SOURCE: AN SSSR. Doklady, v. 161, no. 4, 1965, 836-838

TOPIC TAGS: stereospecific polymerization, polymerization, butadiene polymeriza-  
tion, butadiene, pi-complex

ABSTRACT: Polymerization of dienes was studied with catalyst systems composed of  $\pi$ -cyclopentadienyl Ni-complexes and Lewis acids. These systems represent a new group of stereospecific polymerization catalysts as they do not contain compounds with a  $\sigma$ -metal-hydrocarbon bond. Benzene solutions of bis- $\pi$ -cyclopentadienyl Ni-complex and  $\pi$ -cyclopentadienyl- $\pi$ -cyclopentenyl Ni-complexes along with metal halides are effective catalysts for polymerization of butadiene. The solutions of Ni-complexes and of metal halides were prepared separately and were mixed together in an argon atmosphere. Polymerization experiments were carried out at 50°C and

Card 1/3

L 52264-65

ACCESSION NR: AP5010832

the test duration was 17 hours. Butadiene concentration in the total solution was 2.5 mol/l and concentration of metal halides was  $5 \times 10^{-3}$  mol/l. Polymers were precipitated with HCl acidified ethyl alcohol. The yield and molecular weight of the polymers is a function of the type of Lewis acid used and the ratio between individual components of the catalyst system. A  $(\pi-C_5H_5)_2Ni-TiCl_4$  catalyst system yielded a polymer containing about 90% cis-1,4 groups, 5 to 10% trans-1,4 groups, and no side vinyl groups. Highest polymer yields were obtained with a Ni:Ti ratio of 1. The polymer molecular weight was not higher than 100,000. The  $(\pi-C_2H_5)_2Ni-VCl_4$  catalyst system yields polybutadiene containing up to 96% cis-1,4 groups. Maximum catalytic activity results from a Ni:V ratio of 1. The molecular weight of the polymer is 400,000 to 500,000. The catalyst based on tin-, molybdenum-, and tungsten halides yield polymers with 20 to 50% trans-1,4 groups. Depending upon reaction conditions,  $(\pi-C_5H_5)_2Ni-AlX_3$  catalysts (where X is Cl or Br) yield polybutadiene of 20,000 to 50,000 molecular weight. Catalysts based on  $\pi$ -cyclopentadienyl-dienyl- $\pi$ -cyclopentenyl Ni-complexes perform similarly to bis- $\pi$ -cyclopentadienyl-based systems; both yield polybutadiene containing 92-95% cis-1,4 groups. "The authors are highly indebted to I. G. Kolokoltseva for synthesis of the bis- $\pi$ -cyclopentadienyl Ni-complex." Orig. art. has: 2 tables.
